This product is a class I medical device in accordance with European Directive 93/42/EEC.

NOTICE! Observe operating instructions!

Batch number

LOT ABC123
2 Product description

InPost is an accessory used for designing dental prostheses, which can be worn by several implants. The inPost is installed on multi-unit abutments in order to acquire their relative position to each other and for the model in an extraoral scan.

Materials used: Titan Grade 5.
3 Indications

The inPost is exclusively used to determine the position of a compatible multi-unit abutment in a model, based on which the dental prosthesis is modeled using CAD software.
4 Using inPost

inPost is only intended for extraoral application and must not be used in the mouth.

Measuring implant positions places high demands on the component involved. Ensure that the connecting surfaces between inPost and the multi-unit abutment are not dirty or damaged.

Do not touch the inPost surface with your fingers (contamination by fingerprints). Instead use powderless latex gloves, for example.

Screw the inPost onto the multi-unit abutment provided with minimal exertion until it no longer shakes. A particularly tightly fitted device does not result in higher precision. Check that the inPost is positioned on the shoulder of the multi-unit abutment without any gaps.

To scan the inPost, only an inEos X5 scanner with inLab SW 15.0 software or higher is suitable.
5 Cleaning

If the surface gets dirty, it can be cleaned with a household steam cleaner.
## Compatibility

The following tables list all available inPosts and their compatibility with corresponding multi-unit abutments.
